

TANK MONITORING SOLUTION

WHAT IS TANK MONITORING?

Tank monitoring is a service that allows you and Catalys Lubricants to remotely monitor tank fill levels and usage in real time. It provides access to accurate tank level data via an intelligent, web-based management portal. Our tank monitoring system helps you stay profitable by minimizing or eliminating product outages and costly-last minute orders.

HOW IT WORKS

Your business can be up and running in three simple steps:

1. Telemetry device is installed on each tank for monitoring
2. Tank level measurements are sent wirelessly to the Cloud, where they are processed
3. Fill levels, usage and other tank data are displayed in the management portal
